assessment

1 DAY COURSES

Tiger Scheme and their approved Training Partners provide a range of one day courses aimed at improving security awareness in both the general user population and in terms of individuals with security-relevant roles. Many of these are relevant to security management within the organisation

ITHC Management

The Tiger Scheme ITHC Management course is a one-day course leading to a one-hour multiple choice examination. The course provides an essential background in the specification, justification and management of network technical vulnerability assessments. Candidates are taught the principles of vulnerability assessment, the key points to address when requesting external assessment services, and the issues to address within the organisation to maximise the potential for achieving the underlying objectives. Successful candidates will be awarded Associate level membership of the Scheme.

Forensic Readiness Planning

Being prepared for a security incident can reduce the impact to the organisation, and will increase the likelihood of a successful response. This one day course, leading to Associate membership of the Scheme, teaches the basics necessary for the development of a forensic readiness plan. The course has a one-hour multiple choice assessment at the end of the day, and candidates are expected to achieve a 60% pass mark.

Forensic First Responder

The first person on the scene of an actual or potential security incident is not always the in-house specialist. Vital evidence can go unnoticed, or worse, become mislaid or damaged in the first few minutes. This one day course provides a basic overview of the requirements for digital forensic investigation, without going into the detail necessary for specialist investigators. It also sets out the requirements of evidence handling, and provides background on what should and should not be done when computer crime is suspected. At the conclusion of the course, students will be tested on their awareness, through a multiple choice assessment. The key benefit of this course is that it will increase the user population's level of alertness to possible crime, but will also maximise the likelihood of success in any subsequent investigations.

Tiger Scheme is a not-for profit organisation working in co-operation with The University of South Wales (formerly the University of Glamorgan) to provide an independent, University recognised assessment of the technical, legal and ethical capabilities of penetration testers within the UK. Buyers of penetration testing are vocal of the shortage of certified skill in the UK, and the negative impact this has on project timescales and costs. Tiger Scheme bridges this gap between buyers and suppliers of assessment services. Whilst many UK based certification concentrate purely on commercial service providers, Tiger Scheme offers certification to both professional penetration testers and IT professionals working within internal IT teams. This allows organisations to have leading edge expertise within their own teams, offering greater flexibility and cost effectiveness.
